

LOCK & KEY

A lock is a mechanical device or innovation that is used for fastening any physical entity. This lock is triggered and released with the use of an object called a key. Locks came into existence 6,000 years ago and were used in ancient times to secure palaces and private properties. People in ancient times were always interested in better locks and keys, and the mechanisms that they used. History has laid the foundation for the mechanism of locks and keys to grow and evolve even in the modern era.

In the medieval age, locks and keys became even better. In the Medieval Age lock making was already an established trade . Some of the improvements to locks in the Medieval Age included adding increasingly complex wards to the lock mechanism and the embedding of pivoted tumblers within the locking mechanism.
